

Virginia Small Grains Board Progress Report 2023

Soft Red Winter Wheat Cultivar Development

Nicholas Santantonio, Luciana Rosso and John Seago

216 Latham Hall, School of Plant and Environmental Sciences, Virginia Tech
Blacksburg VA 24061

PROGRESS REPORT

The soft wheat breeding program at Virginia Tech has continued to use marker assisted selection for determining mate pairs for crossing. However, a new genomic prediction algorithm is now being used to predict genome-wide performance for quantitative traits, such as yield and test weight, in addition to markers that track single gene traits, such as rust resistance.

Breeding activities related to SRW are listed in Table 2. Parent selection included 98 inbreds, with 25 elite lines (3+ years of yield evaluation), preliminary lines (2 years of yield evaluation) and 50 observational lines (1 year of yield evaluation), as well as 48 F_1 parents developed in the previous year (2023). All inbred parents were genotyped with 7,225 genome-wide markers using genotyping by sequencing, as well as with KASP and SSR markers designed to track 51 specific known loci for various traits (Table 1). F_1 lines were genotyped *in silico* using parental genotypes. To reduce the cycle time, genomic prediction was used to predict the genetic merit of lines with only a single year of yield evaluation, where observational lines were only observed in one or two of three environments in a sparse testing design. Environments included Blacksburg VA, Warsaw, VA and Urbana IL in collaboration with the University of Illinois. Plans to include a fourth environment in South Carolina with a Clemson University collaborator are in development.

A total of 348 single crosses and 106 top-crosses (F_1 by elite) were made, as well as three double crosses (F_1 by F_1) of specific interest in spring of 2023. Each day, a list of females and males that were ready for crossing was used to create all pairwise crosses *in silico*. A training dataset consisting of data from 2019 to 2022 was used to train the genomic prediction model. Genomic prediction was then used to assign a genetic merit to each potential cross for multiple traits, including yield, test weight and various diseases resistances such as Fusarium Head Blight (FHB), Leaf rust and powdery mildew. Marker information on known loci were also included for each cross and were considered alongside the genomic predictions. Seed from 12 crosses with complementary disease resistance alleles were selected for DH line development in collaboration with KWS. A set of 99 backcrosses were also made to introgress a dominant male sterility gene from New York germplasm into a Virginia germplasm background for the second cycle of backcrossing to facilitate crossing in a future rapid cycling breeding scheme.

During the past year, the breeding program has continued efforts to facilitate development of superior SRW wheat varieties that are widely adapted, high yielding, resistant to disease and insect pests, and meet both local and export market demands. SRW breeding populations (612) were grown in Blacksburg and Warsaw, and will be selected with a bulk approach to select on family mean yield for the F_2 - F_4 generation. Progeny rows derived from SRW (7,680), FHB (8,960), and Doubled Haploid (DH; 945) populations were evaluated in the field at Warsaw, VA in 2023, of which approximately 1,000 lines have been selected for first-year yield trials for 2023. Experimental and elite lines derived from SRW, FHB, MAS, and DH populations were evaluated in yield tests in 2022 (1247) and 2023 (1318), and results for superior lines evaluated in 2022 are presented in Tables 3 and 4. The advanced nursery (year 3+) was combined with the preliminary (year 2) to allow for direct comparisons of breeding values between year 2 and more advanced materials.

Table 1: Table of SRW breeding activities.

Germplasm Type	2021	2022	2023
SRW Single Crosses made	535	352	348
SRW Top- or Double-Crosses made	0	284	109
SRW Single Cross F_1 rows evaluated	13 ^a	361	348
SRW Top Cross F_1 rows evaluated	0	0	255
Scab-MAS Crosses Made for DH Line development	8	8	11
SRW Crosses to KWS for DH Line development	12	14	12
SRW Breeding Populations evaluated	526	655	612
SRW Wheat Progeny Rows evaluated	3618	10560	7680
Scab Progeny Rows and FHB-MAS-DH Rows evaluated	2798	1497	8960
SRW Wheat Doubled Haploid Headrows evaluated	4044	625	945
SRW, Scab, MAS, and DH Lines in Observation Yield Tests	352	924	988
SRW, Scab, MAS, and DH Lines in Preliminary Yield Tests	131	161	278
SRW, Scab, MAS, and DH Lines in Virginia's State Wheat Test	33	40	42
SRW Wheat Varieties Released	0	3	1 ^b

^a In April of 2020, before the arrival of the new PI, a technician failed to dump and clean a sprayer that had been left half full of glyphosate solution, believing it instead contained an insecticide to control for aphids. This solution was sprayed on the plants developing F_1 and top cross seed. The herbicide application killed the plants and subsequently all developing seed. Only a handful (13) of F_1 lines were observed to have survived.

^b Only a single public release was completed in the spring of 2023. The PI is working with industry and CALS to streamline release of new lines for commercial license in the summer of 2023 shortly after performance is evaluated.

One SRW line, 15VDH-FHB-MAS25-15, was selected for public release in 2023. Line 15VDH-FHB-MAS25-15 is a sister line to 15VDH-FHB-MAS33-13, which was released and privately licensed in 2022. Line 15VDH-FHB-MAS25-15 contains the *Fhb1* locus, known to limit the spread of scab within the grain head, and is resistant to scab and leaf rust, and is moderately resistant to powdery mildew. Across three years in the Virginia Tech Official Variety Test, 15VDH-FHB-MAS25-15 ranked 17th in mean grain yield (86.7 bu/ac) across three years, 2020 to 2022, only significantly less than the two highest yielding line 'MAS #143' (90.3 bu/ac) and Dyna-Gro 9172 (90.1 bu/ac; data not shown). This line also exhibited average or above average yield performance in the 221 Gulf Atlantic Nursery in VA, SC, NC, AR and GA. Detailed release documents can be found at github.com/nsantantonio/releases2023.

While the spring (March) timeline for release is suitable for public varieties, this does not work as well for licensing. Industry customers are interested in negotiating licensing shortly after harvest data has been summarized in mid to late summer. The PI is working with CALS and industry partners to streamline release of new lines for commercial license in the summer of 2023 shortly after performance is evaluated.

A plus or minus sign indicates a performance significantly above or below the test average. The 0-9 ratings indicate a genotype's response to disease or lodging where 0 = highly resistant and 9 = highly susceptible.

(Parentheses below column headings indicate the number of site-years in which data were collected.)
